Excerpt: . . . MrscghvygoywGPonfrydrgScavlfney, nsnyCgeerfslgmynmhyRmneavly y 5 the depositional environment and all potentially have some groundwater having SC greater than 200 S cm, though the permeable sand or potential to provide aquifer leakage with known Potomac aquifer contaminants are not associated with limited connections. In addition to these features identified elevated SC ( M. J. Brayton, U. S. Geological Survey, written in drilling cores, other meandering river fluvial deposits may commun. , 2008 ). affect groundwater flow in the Potomac Formation. Clay-Seismic methods, such as the multi-channel analysis filled abandoned channels ( oxbow lakes ) can form barriers to of surface wave ( MASW ) technique, are complementary to flow, while sand and gravel bars can form flow paths, though electrical methods, because the chemistry of the water does they are difficult to correlate with borehole data ( Freeze and not affect the propagation and velocities of the surface seismic Cheery, 1979 ). Benson ( 2006 ) describes the lateral variations wave. In areas of the SCD study site where SC varies over of the different facies within the Potomac Formation that make several orders of magnitude, MASW is essential to making it a heterogeneous and complex hydrogeologic system. A zone lithologic interpretations from DC-resistivity data. Both the of complex faulting in the crystalline basement with offsets of DC resistivity and MASW geophysical techniques were used 5 m or more and undetermined propagation into the Potomac at the SCD site. Line locations were chosen to avoid interfer-Formation is located under and around the site ( Woodruff, ence from metal fences and utilities and to maximize depth 1986; Spoljaric, 1973 ) and has the...
